In the Claims:

- 1. (Currently amended) A green-emitting LED which is designed as a luminescence conversion LED, comprising:
- a primary radiation source, which is a chip emitting in the UV or blue radiation; region[[,]]; and
- a layer of a phosphor which is arranged in front of the primary radiation source and completely or partially converts the radiation of the chip into green light of dominant wavelength $\lambda_{dom} = 550$ to 570 nm[[,]];

characterized in that wherein the phosphor belongs to the class of the oxynitridosilicates, having a cation M and the empirical formula $M_{(1-c)}Si_2O_2N_2:D_c$, where D denotes a doping with divalent europium and where M comprises Sr as a constituent and M=Sr alone or $M=Sr_{(1-x-y)}Ba_yCa_x$ with $0 \le x+y < 0.5$ is used, the oxynitridosilicate completely or predominantly comprising the high-temperature-stable modification HT.

- 2. (Currently amended) The LED as claimed in claim 1, characterized in that wherein the Eu fraction makes up between 0.1 and 20 mol% of M.
- 3. (Currently amended) The LED as claimed in claim 1, characterized in that wherein Sr represents the majority of M and a proportion of M, in particular up to 30 mol%, is replaced by Ba and/or Ca.

- 4. (Currently amended) The LED as claimed in claim 1, eharacterized in that wherein a proportion of M, in particular up to 30 mol%, is replaced by Li and/or La and/or Zn.
- 5. (Currently amended) The LED as claimed in claim 1, characterized in that wherein part of the SiN group in the oxynitridosilicate of formula MSi₂O₂N₂, in particular up to 30 mol%, is replaced by the AlO group.
- 6. (Currently amended) The LED as claimed in claim 1, characterized in that wherein a proportion of Eu, in particular up to 30 mol%, is replaced by Mn.
- 7. (Currently amended) The LED as claimed in claim 1, characterized in that wherein the primary emission has a peak wavelength in the range from 380 to 430 nm, in particular at least 380 nm.
- 8. (Currently amended) The LED as claimed in claim 1, eharacterized in that wherein the green emission has a dominant wavelength in the range from 556 to 564 nm.
- 9. (Currently amended) The LED as claimed in claim 1, characterized in that wherein the primary radiation is completely converted.
- 10. (Currently amended) The LED as claimed in claim 1, eharacterized in that wherein the chip is an InGaN chip with a peak emission wavelength in the range from 430 to 465 nm.

11. (Currently amended) The LED as claimed in claim 1, characterized in that wherein the LED is dimmable.
